About this guide

This guide describes using the $Darwin^{TM}$ SDK to access and use the Darwin API in automated model building. It is intended for data scientists, software engineers and analysts who want to use the Darwin API to interact with Darwin to create and train models, test the generated models, monitor jobs and perform analysis. The SDK also provides some convenience functions. Note that throughout this document, long key and token values are truncated, indicated by ellipses (...).

Expectation

This document assumes experience of the data scientist or software engineer that is commensurate with data science techniques and associated programming tasks.

Darwin overview

Darwin is a SparkCognition $^{\text{IM}}$ tool that automates model building processes to solve specific problems. This tool enhances data scientist potential because it automates various tasks that are often manually performed. These tasks include data cleaning, latent relationship extraction, and optimal model determination. Darwin promotes rapid and accurate feature generation through both automated windowing and risk generation. Darwin quickly creates highly-accurate, dynamic models using both supervised and unsupervised learning methods.

The general workflow for simple modeling includes:

- Upload training data
- Create model
- Upload test data
- · Test the model
- · Download result artifact

Note: Darwin expects all uploaded ingestion files to be in a *rectangular* format. This means a flat file with features that span columns and data samples that span rows. Plan your data file so it fits this expectation to help prevent errors.

See the SDK example for a modeling example.

For additional information on Darwin, contact your local SparkCognition partner for access to the white paper titled: *Darwin - A Neurogenesis Platform*.

Accessing the API

This document describes the python SDK and explains how to access the Darwin API and its functionality. Additional methods to access the Darwin API include:

- through the https://darwin-api.sparkcognition.com/v1 end point
- optionally, through user created curl commands

For additional information on the Darwin API, contact your local SparkCognition partner for access to see the *SparkCognition Darwin API User Guide*.

Notes:

- An API key is necessary to use the Darwin SDK.
 Contact SparkCognition or your IT manager for an appropriate key.
- All methods return a 2-tuple, for example:

```
(True, <context-dependent-return-object>)
(False, <some-helpful-message>)
```

Darwin SDK interface

Setup Darwin SDK

Perform the following to download and setup the Darwin SDK:

- 1. Install Python 3.5 or greater. Alternatively, install *Miniconda*, from https://conda.io/miniconda. html.
- 2. Create a directory to receive the git repository clone.
- 3. Change (cd) into the new directory.
- 4. Clone the darwin-sdk repository:

```
git clone https://github.com/sparkcognition/darwin-sdk
```

5. Change into the new root directory of the *darwin-sdk* cloned darwin-sdk project:

```
cd <NewCloneRootDirectory>
```

Note: By default this is the *master* trunk.

6. Ensure code is from master trunk:

```
git pull
```

7. Setup the SDK:

```
python setup.py install
```

The SDK defaults to using the production URL: https://darwin-api.sparkcognition.com/v1/

Connect to the Darwin interface

1. Obtain an api key.

To use the Darwin SDK, an api key is required. A key can be obtained from SparkCognition support or your IT manager. An api_key is a long string, for example:

"RsJ74ZS5AvwznbHh0AfVSgrchhS9KxACDy3jefaQnxb9f6QTSDBFmhnGa0cOIWtNAIFRAG9ToOTpi0mn"

2. Register the api key.

The purpose of this method is to set a password and an email address for an api_key. Each api_key is synonymous with a service. This method must be invoked once for each api_key to establish a password for that key.

Note: After successful registration, the service uses auth_login() to login as a service.

```
>>> from amb_sdk.sdk import DarwinSdk
>>> s = DarwinSdk()
>>> s.auth_register('asdf', 'iRgwut4kGs0ymULiuKtMd0WFvBYLMWSj16q2uysQeteqH9ssc+\
EETUvcysnPojRpfycLVHa2IlN1IlrfEk1YMA', 'admin@company.com')
```

(True, 'Bearer eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzI1NiJ9.eyJleHAiOjE1MTU1MzM4NjEsImlh\dCI6MTUxNTUzMDI2MS ... F56xZQiBT-89nrRz1nIXD5LfawHIj_MlUHQqM36vU')

3. Login as a *service* or *create a user* under the service and login as a user. The following explains how to log in as a *service*.

Notes:

- Although Bearer <auth-token>, returned by auth_login(), is used in subsequent calls to validate authenticity, it is not required for each method.
- The SDK remembers the auth token for the DarwinSdk object. Although an auth token is currently valid for 1 hour, if the DarwinSdk object session life time exceeds 1 hour, the SDK will request another auth token until the session ends.

Example

```
>>> s.auth_login('asdf', 'iRgwut4kGs0ymULiuKtMd0WFvBYLMWSj16q2uysQeteqH9ssc+EET\
UvcysnPojRpfycLVHa2IlN1IlrfEk1YMA')
(True,'Bearer eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzI1NiJ9.eyJleHAiOjE1MTU1MzQxNzIsImlh\
dCI6MTUxNTUzMD ... UQQfoXqYFKJSoRXXDNPE985-a08cE6_o')
```

When login (as a service) successfully completes, the SDK can be used to create and model a workflow.

Note, there are also <code>auth_register_user()</code> and <code>auth_login_user()</code> methods that allow you to create users and login as a specific user. You can choose to use the SDK as a service or create users underneath the service to partition datasets/models to be owned by specific users. It is more convenient to employ user accounts because the <code>api_key</code> is not necessary for logging in as a user.

Example

```
>>> s.auth_register_user('atestuser', 'apassword', 'anemail')
(True,
    'Bearer eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.eyJqdGkiOiJkNjY0MmJjOCliMmU5LTQxO\
DctODFlNS00YjI2MD ... 5zMp_1FfxU')
>>> s.auth_login_user('atestuser', 'apassword')
(True,
    'Bearer eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.eyJqdGkiOiI3NGYzYmUxZS0yOTlmLTRhN\
zMtODU5ZCO1NGRmM2F ... u1zGCeCONA')
```

4. Verify the connection.

The default url in the SDK is https://darwin-api.sparkcognition.com/v1/. Use get_url() and set_url() to verify connection to the right Darwin service.

Darwin SDK methods

URL Get/Set methods

DarwinSdk.get_url()

Get Darwin service url.

Parameters: None

Returns:

```
(True, <url-string>)
```

Example

```
In [10]: s.get_url()
Out[10]: (True, 'https://darwin-api.sparkcognition.com/v1/')
```

DarwinSdk.set_url(url, version='v1')

Set Darwin service url and version.

Parameters:

- url URL to the Darwin service
- version (optional) defaults to 'v1'

Returns:

```
(True, <url>) or (False, 'invalid url')
```

Example

```
In [9]: s.set_url('https://darwin-api.sparkcognition.com/v1/')
Out[9]: (True, 'https://darwin-api.sparkcognition.com/v1/')
```

Authentication methods

DarwinSdk.auth_register(password, api_key, email)

Register as a service. The purpose of this method is to set a password for an api_key. Each api_key is synonymous with a service. This method is invoked only once for each api_key to establish a password for that key. After registration, the service can use *auth_login()* to login as a service.

Parameters:

- password The service level password
- api_key The api key for the service
- email Email address

```
(True, 'Bearer <auth-token>') or (False, <error-message>)
```

Bearer <auth-token> is used in subsequent calls to validate authenticity.

The SDK remembers the auth token for the DarwinSdk object.

Note: Although an auth token is currently valid for 1 hour, if the DarwinSdk object session life time exceeds 1 hour, the SDK will request another auth token until the session ends.

Example

```
In [4]: s.auth_register('asdf', 'RsJ74ZS5AvwznbHh0AfVSgrchhS9KxACDy\
3jefaQnxb9f6QTSDBFmhnGa0cOIWtNAIFRAG9ToOTpi0mnEo3zFA', 'email')
Out[4]:
(True,
   'Bearer eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.eyJleHAiO...iSdU8xlF4yJk')
```

DarwinSdk.auth_login(password, api_key)

Login as a service.

Note: A service must have a password set using *auth_register()* to login successfully.

Parameters:

- password The service level password
- api_key The api key for the service

Returns:

```
(True, 'Bearer <auth-token>') or (False, <error-message>)
```

Bearer <auth-token> is used in subsequent calls to validate authenticity. The SDK remembers the auth token for the DarwinSdk object.

Note: Although an auth token is currently valid for 1 hour, if the DarwinSdk object session life time exceeds the 1 hour limit, the SDK will acquire another auth token until the session ends.

```
In [5]: s.auth_login('asdf',
   'iRgwut4kGs0ymULiuKtMd0WFvBYLMWSj16q2uysQeteqH9ssc+EETUvcysnPojRpfyc\
LVHa2IlN1IlrfEk1YMA')
Out[5]:
(True,
```

```
'Bearer
eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzI1NiJ9.eyJleHAiOjE1MTU1MzQxN....')
```

DarwinSdk.auth_register_user(username, password, email)

Register a user. This method registers a new user.

Note: You must be logged in as a service to create a user.

Parameters:

- username The new end user's username
- password The new end user's password
- email The new end user's email address

Returns:

```
(True, 'Bearer <auth-token>') or (False, <error-message>)
```

Bearer <auth-token> is used in subsequent calls to validate authenticity. The SDK remembers the auth token for the DarwinSdk object.

Note: Although an auth token is currently valid for 1 hour, if the DarwinSdk object session life time exceeds the 1 hour limit, the SDK will acquire another auth token until the session ends.

Example

```
In [8]: s.auth_register_user('user1', 'user1-password', 'user-email',
   'iRgwut4kGs0ymULiuKtMd0WFvBYLMWSj16q2uysQeteqH9ssc+EETUvcysnPojRpfycLV\
Ha2IlN1IlrfEk1YMA')
Out[8]:
(True,
   'Bearer
eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzI1NiJ9.eyJleHAiOjE1MTU1MzQyN....')
```

DarwinSdk.auth_set_email(username, email)

Add or change a user's email address.

Parameter:

- username The end user's username
- email The end user's email address

Returns:

```
(True, None) or (False, <error-message>)
```

User must be logged in to add or change an email address. This email address will be used for password resets and other notifications.

Example

```
In [9]: s.auth_set_email('user1', 'user1@company.com')
Out [9]: (True, None)
```

DarwinSdk.auth_login_user(username, password)

Login as a user.

Note: A user must have a username and password set using **auth_register_user**() to successfully login.

Parameters:

- username The end user's username
- password The end user's password

Returns:

```
(True, 'Bearer <auth-token>') or (False, <error-message>)
```

Bearer <auth-token> is used in subsequent calls to validate authenticity. The SDK remembers the auth token for the DarwinSdk object.

Note: Although an auth token is currently valid for 1 hour, if the DarwinSdk object session life time exceeds the 1 hour limit, the SDK will acquire another auth token until the session ends.

Example

```
In [9]: s.auth_login_user('user1', 'user1-password',
'iRgwut4kGs0ymULiuKtMd0WFvBYLMWSj16q2uysQeteqH9ssc+EETUvcysnPojRpfycLV\
Ha2IlN1IlrfEk1YMA')
Out[9]:
(True,
'Bearer
eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzI1NiJ9.eyJleHAiOjE1MTU1MzQzM....')
```

DarwinSdk.auth_change_password(curpass, newpass)

Change the current user's password.

Parameters::

- curpass User's current password
- newpass User's new password

```
(True, None) or (False, <error-message>)
```

User must be logged in to change password. If the current password is forgotten, use the following **DarwinSdk.auth_reset_password (username)** method to reset it. An email will be generated with a temporary password.

Example

```
In [10]: s.auth_change_password('mypassword', 'newpassword')
Out[10]: (True, None)
```

DarwinSdk.auth_reset_password(username)

Reset a user's password. A temporary password will be sent to the user's email address.

Parameter:

• username - Username to reset password for.

Returns:

```
(True, <deleted-user-id>) or (False, <error-message>)
```

Example

```
In [8]: s.auth_reset_password('username')
Out[8]: (True, None)
```

DarwinSdk.auth_delete_user(username)

Remove/Unregister a user.

Parameter:

• username - Username of the user to be deleted.

Returns:

```
(True, <deleted-user-id>) or (False, <error-message>)
```

You must be logged in with your api_key and password to delete a user.

```
In [8]: s.lookup_username('testuser2')
Out[8]:
(True,
 [{'client_api_key': 'RsJ74ZS5AvwznbHh0AfVSgrch...Eo3zFA',
   'created_at': '2018-01-03T12:54:30.653478',
   'parent_id': '2516b462-df85-11e7-bdd1-e37424c63ea4',
   'tier': 0,
   'username': 'testuser2'}])
In [9]: s.auth_delete_user('testuser2')
Out[9]: (True, '87d721fc-f0b7-11e7-b58d-a3441423b160')
In [10]: s.auth_delete_user('testuser2')
Out [10]:
(False,
 '404: NOT FOUND - {\n
                          "message": "Username not found. \
You have requested this URI [/v1/auth/register/user/testuser2] \
but did you mean /v1/auth/register/user/ <username> or /v1/auth/register/user \
 or /v1/auth/register ?"\n}\n')
```

Job status methods

DarwinSdk.lookup_job_status(age=None, status=None)

Get status information for all jobs belonging to the current user or service.

Parameters:

- age (optional) Filter jobs that are less than X units old, for example 3w, 2d, or 1h.
- Optional parameters:
 - status If not specified, returns all jobs.
 - running (Note that only 2 jobs can be running concurrently.)
 - requested
 - complete
 - failed

Returns:

```
(True, <list-of-jobs>) or (False, <error-message>)
```

```
In [6]: s.lookup_job_status(status='Complete')
Out[6]:
(True,
  [{'artifact_names': None,
   'dataset_names': ['cancer-train'],
```

```
'endtime': '2018-02-01T10:53:50.451598',
'generations': 0,
'job_name': 'eeef500d629e4a2185eb8af6e18a83b4',
'job_type': 'TrainModel',
'loss': 2.0,
'model_name': 'cancer-model',
'percent_complete': 100,
'starttime': '2018-02-01T10:52:42.280929',
'status': 'Complete'}])
```

DarwinSdk.lookup_job_status_name(job_name)

Get job status information for a job by its name.

Parameters:

• *job_name* - The name of the job you want status on

Returns:

```
(True, <job-info>) or (False, <error-message>)
```

Example

DarwinSdk.delete_job(job_name)

Delete a job.

Parameter:

• job_name - The name of the job you want to delete

Returns:

```
(True, None) or (False, <error-message>)
```

Example

```
In [17]: s.lookup_job_status_name('7df54dfddfa046d581522f7540e3256c')
Out[17]:
(True,
 {'artifact_names': ['7a245119ca3b42efadc27006e75a225d'],
  'dataset_names': ['market-train'],
  'endtime': '2018-03-06T14:23:59.975793',
  'generations': None,
  'job_error': '',
  'job_type': 'AnalyzeData',
  'loss': None,
  'model_name': None,
  'percent_complete': 100,
  'starttime': '2018-03-06T14:23:57.18095',
  'status': 'Complete'})
In [18]: s.delete_job('7df54dfddfa046d581522f7540e3256c')
Out[18]: (True, None)
In [19]: s.lookup_job_status_name('7df54dfddfa046d581522f7540e3256c')
Out[19]: (False, '404: NOT FOUND - \{\n "message": "Job name not found"\n\}\n')
```

DarwinSdk.stop_job(job_name)

Stop a job.

Parameter:

• *job_name* - The name of the job.

Returns:

```
(True, 'Job is scheduled to stop') or (False, <error-message>)
```

```
In [21]: s.stop_job('34787793a48b42b48a319bbbf68f13ea')
Out[21]: (True, 'Job is scheduled to stop')
```

Lookup methods

DarwinSdk.lookup_artifact(type=None)

Get a list of artifacts belonging to the current user or service.

Parameter:

• type - (optional) specifies the type of artifact. Values can be 'Model', 'Dataset', 'Run'.

Returns:

```
(True, <artifact-list>) or (False, <error-message>)
```

Example:

```
In [30]: s.lookup_artifact('Run')
http://localhost:5000/v1/lookup/artifact
Out[30]:
(True,
   [{'created_at': '2018-02-01T11:09:55.731040',
        'id': 'b9a9205a-0772-11e8-a003-3b1c8766dad0',
        'mbytes': 0.0,
        'name': '8a63e21030d1483abb0f892963c1728f',
        'type': 'Run'},
        {'created_at': '2018-02-01T11:11:17.560360',
        'id': 'ea6f3f80-0772-11e8-9abe-77bc32e350c5',
        'mbytes': 0.0,
        'name': 'artifact-1',
        'type': 'Run'}]
```

DarwinSdk.lookup_artifact_name(artifact_name)

Get information for an artifact specified by its name.

Parameter:

• artifact - specifies an artifact by its name

Returns:

```
(True, <job-info>) or (False, <error-message>)
```

```
'type': 'Run'})
```

DarwinSdk.lookup_limits()

Get a client's metadata. A client is the current user or service in context.

Parameters: None

Returns:

```
(True, <client-info>) or (False, <error-message>)
```

Example

DarwinSdk.lookup_dataset()

Get the dataset(s) metadata for a user. The user is the current user or service in the current context. This is useful for listing all created datasets.

Parameters: None

Returns:

```
(True, st-of-dataset-info>) or (False, <error-message>)
```

```
In [4]: s.lookup_dataset()
Out[4]:
(True,
    [{'categorical': None,
        'imbalanced': None,
        'mbytes': 0.02019977569580078,
        'name': 'unittest-cancer-dataset2',
        'sequential': None,
        'updated_at': '2018-01-31T15:37:28.310994'},
        {'categorical': None,
```

```
'imbalanced': None,
'mbytes': 0.02019977569580078,
'name': 'cancer-train',
'sequential': None,
'updated_at': '2018-02-01T10:52:06.076279'}])
```

DarwinSdk.lookup_dataset_name(dataset_name)

Get a specific dataset's metadata.

Parameters:

• dataset_name - The name of the dataset. The name of a dataset is established in the **up-load_dataset()** method.

Returns:

```
(True, <dataset-info>) or (False, <error-message>)
```

Example

DarwinSdk.lookup_model()

Get the model(s) metadata for a user. The user is the current user or service in the current context. This is useful for listing all models.

Parameters: None

Returns:

```
(True, <list-of-model-info>) or (False, <error-message>)
```

```
In [37]: s.lookup_model()
Out[37]:
(True,
  [{'generations': 0,
   'loss': 2.0,
```

```
'name': 'cancer-model',
   'parameters': {'target': 'Diagnosis'},
   'trained_on': ['cancer-train'],
   'updated_at': '2018-02-01T10:53:50.443166',
   'description': {"best_genome": "DeepNet(\n (10): LSTM(20, 18, num_layers=2)\n (11): Linear(in_features=18, out_features=1, bias=True)\n)", "recurrent": true}
}]
)
```

DarwinSdk.lookup_model_name(model_name)

Get a specific model's metadata. The name of a model is established in the create_model() method.

Parameters:

• model_name - The name of the model

Returns:

```
(True, <model-info>) or (False, <error-message>)
```

Example

```
In [40]: s.lookup_model_name('cancer-model')
Out[40]:
(True,
    [{'generations': 0,
        'loss': 2.0,
        'parameters': {'target': 'Diagnosis'},
        'trained_on': ['cancer-train'],
        'updated_at': '2018-02-01T10:53:50.443166',
        'description': {"best_genome": "DeepNet(\n (10): LSTM(20, 18, num_layers=2)\n (11): Linear(in_features=18, out_features=1, bias=True)\n)", "recurrent": true}
}]
```

DarwinSdk.lookup_tier()

Get metadata for all tiers. A tier specifies certain usage limits such as number of models and datasets.

Parameters: None

Returns:

```
(True, st-of-tier-info>) or (False, <error-message>)
```

```
In [41]: s.lookup_tier()
Out[41]:
(True,
    [{'job_limit': None,
        'model_limit': None,
        'tier': 0,
        'upload_limit': None,
        'user_limit': None},
        {'job_limit': 10000,
        'model_limit': 10000,
        'tier': 1,
        'upload_limit': 10000,
        'user_limit': 10000])
```

DarwinSdk.lookup_tier_num(tier_num)

Get a specific tier's metadata. A tier specifies certain usage limits such as the *number of models* or *datasets*.

Parameters:

• *tier_num* - The name of the model

Returns:

```
(True, <tier-info>) or (False, <error-message>)
```

Example

DarwinSdk.lookup_user()

Returns information for users that were created with the current api_key.

Note: Each customer site is assigned a *unique api_key*. All users from that site have the same api_key.

Parameters: None

Returns:

(True, <list-of-user-info>) or (False, <error-message>)

Example

```
In [25]: s.lookup_user()
Out [25]:
(True,
 [{'client_api_key': 'RsJ74ZS5AvwznbHh0AfVSgrchhS9...3zFA',
   'created_at': '2018-01-03T12:54:30.653478',
   'parent id': '2516b462-df85-11e7-bdd1-e37424c63ea4',
   'tier': 0,
   'username': 'testuser2'},
  {'client_api_key': 'RsJ74ZS5AvwznbHh0AfVSgrchhS9...3zFA',
   'created_at': '2018-01-03T13:14:36.188371',
   'parent_id': '2516b462-df85-11e7-bdd1-e37424c63ea4',
   'tier': 0,
   'username': 'testuser5'},
  {'client_api_key': 'RsJ74ZS5AvwznbHh0AfVSgrchhS9...3zFA',
   'created_at': '2018-01-03T13:21:21.099148',
   'parent_id': '2516b462-df85-11e7-bdd1-e37424c63ea4',
   'tier': 0,
   'username': 'testuser6'}])
```

DarwinSdk.lookup_username(username)

Returns information for a user.

Notes:

- The user in question should have been created using the current api_key.
- Each customer site is assigned a unique api_key. All users from that site have the same api_key.

Parameters: None

Returns:

```
(True, <user-info>) or (False, <error-message>)
```

```
In [26]: s.lookup_username('testuser2')
Out[26]:
(True,
   [{'client_api_key': 'RsJ74ZS5AvwznbHh0AfVSgrchhS9...3zFA',
    'created_at': '2018-01-03T12:54:30.653478',
    'parent_id': '2516b462-df85-11e7-bdd1-e37424c63ea4',
    'tier': 0,
    'username': 'testuser2'}])
```

Datasets and artifact methods

DarwinSdk.upload_dataset(dataset, dataset_name=None)

Upload a dataset.

Note: Supported file formats are .csv and .h5.

Note: The maximum size that can be uploaded is 10GB. Files larger than ~2GB can be processed by analyze_data() only. Model creation might not be successful for files larger than ~2GB until Big Data is fully supported. Analyze_data() is the only method that supports Big Data.

Parameters:

- · dataset- Path to dataset
- dataset_name Name to be given to dataset, or defaults to filename

Returns:

```
(True, {dataset_name: <name-given-to-dataset>}) or (False, <error-message>)
```

Example

DarwinSdk.download_dataset(dataset_name)

Download a dataset artifact given its name.

Parameters:

• dataset_name - Name of the dataset to be downloaded.

Returns:

```
(True, <path-to-file>) or (True, <python-list>) or (False, <error-message>)
```

Example

DarwinSdk.delete_dataset(dataset_name)

Delete the named dataset.

Parameters:

• dataset_name - Name of the dataset to be deleted.

Returns:

```
(True, None) or (False, <error-message>)
```

Example

```
In [6]: s.delete_dataset('unittest-cancer-dataset')
Out[6]:
(True, None)
```

DarwinSdk.download_model(model_name, path=None)

Download a supervised model given its name.

Parameters:

- model_name Name of the model to be downloaded.
- *path* (optional) Relative or absolute path of the directory to download the model to. This directory must already exist prior to model download. If no path is specified, the current directory is used. There are two files associated with a model: 'model' and 'data_profiler'.

Returns:

```
(True, None) or (False, <error-message>)
```

Example

```
In [6]: s.download_model('my-model-name', path='Users/auser/Downloads/mymodel')
Out[6]:
(True, None)
% ls -l ~/Downloads/mymodel
total 272
-rw-r--r- 1 auser staff 58609 Oct 10 15:55 data_profiler
-rw-r--r- 1 auser staff 75507 Oct 10 15:55 model
```

DarwinSdk.download_artifact(artifact_name, artifact_path=None)

Download artifact given its name. The methods that return artifacts are:

- analyze_data()
- analyze_model()
- analyze_predictions()
- run_model()

Note: The artifact for *analyze_model()* is a pandas Series. The artifact displays a two-column series where the name of the feature is in the first column and the second column is a number between 0 and

1 indicating how much that feature influenced the model's predictions over the entire dataset that the model was trained on.

Note: The artifact for *analyze_predictions* is a pandas DataFrame. The artifact has one column for each feature that indicates how much that feature influenced the model's prediction, plus additional columns for the average model prediction ("base_value"), and the model prediction for each row ("predicted_value" for regression or "predicted-class" and "predicted_probability" for classification).

Parameters:

- artifact_name Name of the artifact to download.
- artifact_path: (optional) Relative path of the directory to download the artifact to (only applicable for the artifacts where a temporary file is created). This directory must already exist prior to artifact download.

Returns:

```
(True, <path-to-file>) or (True, <python-list>) or (False, <error-message>)
```

Example run model() or prediction artifact

```
In [16]: s.download_artifact('5da17d64be9c4441899316edb9afd403')

DarwinSdk.delete_artifact(artifact_name)

Delete the artifact given its name.

Parameters:

• artifact_name - Name of the artifact to be deleted.

Returns:

```
(True, None) or (False, <error-message>)
```

```
In [8]: s.delete_artifact('6c482eac9f894cdb9b0e1e487e41730a')
Out[8]:
(True, None)
```

Data Analysis and Data Cleaning methods

DarwinSdk.analyze_data(dataset_name, **kwargs)

Analyze the dataset given its *name*. Basic statistics about the data are returned. This method supports Big Data (greater than 2GB) although *upload_dataset()* is artificially limited to 10GB for version 1.4.

Note:Please contact us if you have data greater than 10GB. We would like to see a sampling of the large datasets that you'd like to see supported.

Parameters:

dataset_name - The name of the dataset to be analyzed.

- **kwargs variable number of keyword arguments, described below:
 - *job_name* (optional) If not specified, a uuid will be created as the job_name.
 - artifact_name: (optional) If not specified, a unid will be created as the artifact_name.
 - *max_unique_values*: Expected input/type: *integer*. Default value of 15. Threshold for automatic pruning of categorical columns prior to one hot encoding based on the number of unique values.

 Note: If a categorical column contains at least *max_unique_values*, it is dropped during preprocessing prior to one hot encoding.

Returns:

```
(True, {"job_name": <string>, "artifact_name": <string>}) or (False, <error-message>)
```

Statistics included in the artifact:

- *col_name* name of the column (any periods ('.') in the column name will be replaced by underscores ('_'))
- *col_type* type of column
- *drop* returns True if column is dropped for modeling. Also returns True if the number of unique values is greater than the number defined in *max_unique_values* (default of 15) or if it has more than 80% missing values or has a standard deviation of 0.
- is_cat returns True for categorical otherwise returns False
- max column maximum
- mean column mean
- min column minimum
- missing percentage of missing values
- *num_uniques* number of unique values if the distinct count is less than the number defined in *max_unique_values* (default of 15), otherwise the value is the approximate number of unique values.
- scalable returns True if column is scalable
- stddev column standard deviation
- *uniques* actual unique values if there are less than the number defined in *max_unique_values* (default of 15). Otherwise, nothing is returned, see *num_uniques* for the approximate number of unique values.

DarwinSdk.clean_data(dataset_name, **kwargs)

Clean the dataset given its name. The output is the cleaned dataset which is scaled and one-hot-encoded based on parameters in <code>analyze_data()</code>. Use <code>download_dataset()</code> to retrieve the cleaned dataset. **Note:** <code>analyze_data()</code> must be run first before <code>clean_data()</code> can be run. <code>clean_data()</code> is only used for visualizing what Darwin would do or for when you want to use the cleaned data outside of Darwin. Do not clean data and then train on the cleaned data with Darwin. Invoking <code>create_model()</code> has its own cleaning function as part of the model creation process.

Parameters:

- dataset_name The name of the dataset to be analyzed.
- **kwargs variable number of keyword arguments, described below:
 - job_name (optional) If not specified, a uuid will be created as the job_name.
 - artifact_name: (optional) If not specified, a unid will be created as the artifact_name.

Modeling and analysis methods

DarwinSdk.create_model(dataset_names, **kwargs)

Create a model trained on the dataset identified by dataset_names. The name of a model is specified in a parameter in kwargs.

Note: If no name is specified, the model is named with a *uuid-like* name.

Parameters:

dataset_names - A single dataset name as a string or a list of dataset string names to be used for training**kwargs - variable number of keyword arguments, described in parameters.

parameters -

- *model_name*: The string identifier of the model to be trained. If no name is specified, the model is named with a *uuid-like* name.
- *job_name*: If no name is specified, the job is named with a *uuid-like* name.
- *target*: String denoting target prediction column in input data. If the target is not specified, the model would default to unsupervised.
- *max_train_time* (supervised only): Sets the training time for the model in 'HH:MM' format. Default value is 00:01.
- *max_epochs* (unsupervised only): Expected input/type: *numeric*. Sets the training time for the model in epochs. Default value is 10.
- *recurrent*: Expected input/type: *true/false*. Enables recurrent connections to be evolved in the model. This option can be useful for timeseries or sequential data.

Note: This option is automatically enabled if a *datetime* column is detected in the input data. This can result in slower model evolution.

• impute: String alias that indicates how to fill in missing values in input data.

ALIAS	DESCRIPTION	COMPLEXITY
'ffill'	(Default) Forward Fill: Propagate values forward from one example	Linear
	into the missing cell of the next example. Might be useful for	Fast
	timeseries data, but also applicable for both numerical and	
	categorical data.	
'bfill'	Backward Fill: Propagate values backward from one example into	Linear
	the missing cell of the previous example. Might be useful for	Fast
	timeseries data, but also applicable for both numerical and	
	categorical data.	
'mean'	Mean Fill: Computes the mean value of all non-missing examples	Linear
	in a column to fill in missing examples. The result may or might	Fast
	not be interpretable in terms of the input space for categorical	
	variables.	
'median'	Median Fill: Computes the median value of all non-missing	Linear
	examples in a column to fill in missing examples. While the result	Fast
	is interpretable in terms of the input space for categorical variables,	
	the approach might not be appropriate for non-ordinal data.	
'mode'	Mode Fill: Uses the most common value on a column-by-column	Linear
	basis to fill in missing examples. The result is interpretable for	Fast
	both numerical and categorical variables.	
'spline'	Spline Fill: Interpolation using a spline (piecewise function). Might	Linear
	be useful for timeseries or sequential data.	Fast
'Linear'	Linear Interpolation Fill: Interpolation using a Linear function.	Linear
	Might be useful for timeseries or sequential data.	Fast

- drop: Expected input/type: true/false. Enables automatic pruning of input columns based on different criteria such as amount of missing data, number of unique values, and standard deviation.
 Note: This automatically drops identifier columns (unique value for each sample) and columns that do not contain sufficient data to aid prediction.
- max_int_uniques: Expected input/type: integer. Threshold for automatic encoding of categorical variables. If a column contains less than max_int_uniques unique values, it is treated as categorical and one hot encoded during preprocessing. **Note:** If the target has more numeric values than the max_int_uniques set point, the problem is treated as a regression and will use MSE.
- max_unique_values: Expected input/type: integer. Threshold for automatic pruning of categorical columns prior to one hot encoding based on the number of unique values.
 Note: If a categorical column contains at least max_unique_values, it is dropped during preprocessing prior to one hot encoding.
- *feature_eng*: Enables automatic feature generation. Identifies an appropriate time window and augments input with new features derived in the frequency and time domains.

Note: Can only be applied to timeseries data. String aliases specify methods for window computation.

ALIAS	DESCRIPTION
ʻmi'	Uses mutual information to estimate the window length.
'auc'	$(\mbox{\bf Default})$ Uses autocorrelation to estimate the window length.
'user'	User specified window length: see window_len.

- *window_len*: Expected input/type: *integer*. User specified window length for feature generation.

 Note: This parameter is used only in the case that *user* is provided for the *feature_eng* parameter.
- *feature_select*: A number in [0,1] specifying the percentage of numerical features to maintain based on their dependency to the target. Ranks all features using mutual information and drops (1 feature select)% of the lowest-ranking features. Default is **1** (keep all features).
- *outlier*: A string alias that indicates the outlier detection to apply during preprocessing. **Note**: Outliers are removed and later filled using imputation.

ALIAS	DESCRIPTION
None	(Default) No outlier detection is applied.
'mad'	Uses Median Absolute Deviation to detect outliers.
'perc'	Uses Percentile-based outlier detection.
ʻisol'	Uses an Isolation Forest to detect outliers.

- *auto_save_per* (supervised only): Expected input/type: *integer*. Sets the checkpoint frequency. The model creation progress is recorded after every auto_save_per generations.
 - **Note**: If the model is retrained, the model begins from the last recorded checkpoint. The model is automatically saved at the end of evolution.
- *imbalance* (supervised only): Expected input/type: *true/false*. Enables automatic imbalance correction that selectively applies random oversampling, random undersampling, synthetic minority oversampling (SMOTE), or adaptive synthetic sampling (ADASYN) to the input data depending on problem characteristics.
- *clustering* (unsupervised only): Enables clustering for unsupervised problems. If false, detects outliers.
- *n_clusters* (unsupervised only): Expected input/type: *integer*. Specifies the number of clusters. **Note**: If this value is not provided, the number of clusters will be heuristically determined.
- *anomaly_prior* (unsupervised only): Expected input/type: *between* [0,1]. Significance level at which a point is defined as anomalous. This is only used for unsupervised problems if *clustering* is disabled.
- loss_func: Specify the loss function. Possible values include: "CrossEntropy", "MSE", "BCE", "L1", "NLL", "BCEWithLogits", "SmoothL1". "CrossEntropy" can be used for classification data, while all others can be used for regression data. The default value is CrossEntropy if this field is left empty.
- *lead_time_days* (*nbm* only): Expected input/type: *integer*. Default value is 60. The number of days prior to failure when the behavior starts trending toward either abnormal behavior or failure.

- *nbm_window_size* (*nbm* only): Expected input/type: *integer*. Default value is 256. The number of sample points to consider for each failure detection.
- *nbm* (*nbm* only): Expected input/type: *true*/*false*. Default value is false. Set value to true for a normal behavioral model (NBM).
- *failure_dates* (*nbm* only): Expected input/type: *string*. List of failure dates to use for the calculation. Currently, only a list of one date can be used in the query. Example date format: "07/01/2015"
- recovery_dates (nbm only): Expected input/type: string. List of recovery dates to use for the calculation. Currently, only a list of one date can be used in the query. Example date format: "11/01/2015"

```
(True, {'job id': <uuid1>, model name: <model name>}) or (False, <error-message>)
```

Example

DarwinSdk.delete_model(model_name)

Delete a model named by model name.

Parameters:

• model_name - Name of the model to be deleted.

Returns:

```
(True, None) or (False, <error-message>)
```

Example

```
In [5]: s.delete_model('unittest-cancer-model')
Out[5]: (True, None)
```

DarwinSdk.resume_training_model(model_name, dataset_names, **kwargs)

Resume training for a model on the dataset(s) identified by dataset_names.

Parameters:

- model_name Name of the model to be trained.
- dataset_name- Name of dataset(s) used for training.

- **kwargs variable number of keyword arguments, described below:.
 - job_name If not specified, a uuid is created as the job_name.
 - max_train_time If not specified, the default is used.

```
(True, {"job_id""<uuid>", "model_name": "<model_name>"}) or (False, <error-message>)
```

Example

```
In [8]: s.resume_training_model('unittest-cancer-model', 'unittest-cancer-\
dataset', max_train_time="00:01")
Out[8]:
(True, {"job_id": "4e59ffc425e047e1a3b872f1e7396976", "model_name": "unittest-\
cancer-model"})
```

DarwinSdk.analyze_model(model_name, job_name=None, artifact_name=None)

Analyze the universal feature importances for a particular model given the model name.

Parameters:

- model_name The name of the model to be analyzed.
- job name (optional) If not specified, a uuid is created as the job name.
- artifact_name (optional) If not specified, a uuid is created as the artifact_name.
- *category_name* (optional) The name of the class for supervised or cluster for unsupervised to get feature importance for. If this is not specified, the feature importance will be over all classes/clusters.

Returns:

```
(True, {"job_name": <string>, "artifact_name": <string>}) or (False, <error-message>)
```

Example

```
In [5]: s.analyze_model('unittest-cancer-model')
Out [5]:
(True, {'artifact_id': '71a8ae55f2934014b45c13a3975f419c', 'job_id': \
'4e59ffc425e047e1a3b872f1e7396976'})
```

DarwinSdk.analyze_predictions(model_name, dataset_name, job_name=None, artifact_name=None)

Analyze specific feature importances for a particular sample or samples given the model name and sample data.

Parameters:

• *dataset_name* - The name of the dataset containing the data to analyze predictions for. This is a new dataset that was not used during training for which you want feature importance scores for each row of this dataset. This dataset has a limit of 500 rows. There is no limit for columns.

- model_name The name of the model to be analyzed.
- job_name (optional) If not specified, a uuid is created as the job_name.
- artifact_name (optional) If not specified, a unid is created as the artifact_name.

```
(True, {"job_name": <string>, "artifact_name": <string>}) or (False, <error-message>)
```

Example

```
In [5]: s.analyze_predictions('model_name', 'dataset_name')
Out [5]:
(True, {'artifact_name': '71a8ae55f2934014b45c13a3975f419c', 'job_name': \
'4e59ffc425e047e1a3b872f1e7396976'})
```

DarwinSdk.run_model(dataset_name, model_name, job_name=None, artifact_name=None)

Run the model given its name and a dataset to use. Use **upload_dataset()** to upload a data set.

Parameters:

- dataset_name The name of a dataset to use for running the model.
- model name The name of the model to run.
- *supervised* (**Deprecated**: This argument exists only for backward compatibility.) (optional) A boolean (true/false) indicating whether the model is supervised or not, for example, set this to *false* for *unsupervised*.
- job_name (optional) If not specified, a uuid is created as the job_name.
- artifact name (optional) If not specified, a unid is created as the artifact name.

Returns:

```
(True, {"job_name": <string>, "artifact_name": <string>}) or (False, <error-message>)
```

Example

```
[In [9]: s.run_model('unittest-cancer-testdataset', 'unittest-cancer-model')
Out [9]:
(True, {'artifact_id': '6c482eac9f894cdb9b0ele487e41730a', 'job_id': \
'1696e03c8165404c8e05685ea68baa3c'})
```

Convenience methods

DarwinSdk.delete_all_datasets()

Deletes user datasets. This method deletes all datasets in the current user or service context.

Note: Use *lookup_dataset()* to view/verify the datasets for deletion.

Parameters: None

```
(True, None) or (False, <error-message>)
```

DarwinSdk.delete_all_models()

Delete all models for a user. This method will delete all models in the current user's or service's context. **Note**: Use *lookup_model()* to review and verify that you want to delete all listed models.

Parameters: None

Returns:

```
(True, None) or (False, <error-message>)
```

DarwinSdk.wait_for_job(job_name, time_limit=600)

Synchronously wait for a job to complete, limited by time_limit that defaults to 600 seconds.

Parameters:

- *job_name* The id for the job
- time_limit (optional) defaults to 600 seconds

Returns:

```
(True, None) or (False, <error-message>)
```

Revision Table

Version	Date	Notes
v 1.0	05-Feb-2018	Initial Release
v 1.2	28-Mar-2018	Added:
		 DarwinSdk.auth_change_password
		• DarwinSdk.delete_job
		• DarwinSdk.stop_job
		 DarwinSdk.lookup_user
		 DarwinSdk.lookup_username
		DarwinSdk.auth_delete_user
		Name change: lookup_client to lookup_limits
v 1.3	23-May-2018	Added:
		DarwinSdk.auth_reset_password
		DarwinSdk.auth_set_email
		 DarwinSdk.analyze_predictions
		Updated endpoints:
		DarwinSdk.auth_register_user
		• DarwinSdk.analyze_model
v 1.3.1	14-Jun-2018	Fixed issues only. See Release Notes.
v 1.4	31-Jul-2018	 Island Models implemented to allow model types to reproduce
		at their own speeds
		 User selectable loss functions
		 Output model confidence value
		 Specify download paths for artifacts
		Parameter validation
		Stored data is encrypted
		 DarwinSdk.lookup_model() and
		DarwinSdk.lookup_model_name(model_name) calls
		display model description
